Profile

- Backend-focused Full Stack Developer specializing in **high-concurrency systems, financial data integrity, and scalable SaaS architectures**.
- Experienced in solving **race conditions, transaction safety issues, and distributed system challenges** in production environments.

Skills

- **Programming Languages:** Python, JavaScript (ES6+), CSS
- **Frontend Technologies:** React.js, React Query, Redux Toolkit, WebSockets, MUI, Tailwind CSS, Ant Design
- **Backend & Data Systems:** Django, PostgreSQL, Redis, Celery, Django Channels, PL/pgSQL Triggers, Event-driven Architecture, Cache Management
- **Tools:** Git, Postman, VScode, Github, Vite
- **Cloud Services:** Cloudinary, Vercel, Render, Aws, Netlify, Supabase
- **Soft Skills:** Problem-solving, Team Collaboration, Critical Thinking
- **Additional Skills:** Django Channels, ES6, Custom Hooks, React Hooks, Performance Optimization, Responsive Design, Animation with Framer Motion

Projects

ViknBooks (Production SaaS Platform) | *Django, PostgreSQL, Redis, Celery, React, WebSockets* Jan 2025 – Present

- **Developing a multi-tenant accounting platform** handling high-volume financial transactions across multiple organizations.
- **Solved critical race conditions in voucher generation** by designing concurrency-safe logic ensuring uniqueness under high parallel requests.
- **Reduced database query load significantly** through optimized query patterns, indexing, and Redis caching.
- **Implemented idempotent APIs** to safely handle retries and prevent duplicate financial entries in distributed environments.
- **Implemented automated grace-period bill reversion** ensuring data consistency by safely rolling back unconfirmed financial transactions.
- **Built asynchronous processing pipelines using Celery** for heavy operations such as invoicing and reporting.
- **Integrated real-time updates using WebSockets (Django Channels)** for multi-client synchronization.
- **Ensured data integrity using transaction-safe operations** and proper rollback handling.
- [Preview](#)

InstyTution | *Python, Django, Django Channels, WebRTC, WebSockets, React, Redux, Redis, Postgres, MUI, AWS* Ongoing

- Built a multi-role educational platform with integrated e-commerce functionality.
- **Implemented real-time live video classes using WebRTC** supporting multi-user interactive sessions similar to Zoom.

- Developed backend services using Django REST Framework for user management, course handling, and live session coordination.
- Integrated WebSockets (Django Channels) for real-time communication and session updates.
-  [GitHub Repository](#)

NFC-Based Office Access System | *Django, React, Role-Based Systems, Access Control* Ongoing

- **Developed the core admin system** for managing employees, roles, and access permissions for an NFC-based office access platform.
- **Designed role-based access control (RBAC)** to define and assign permissions for door-level and user-level access management.
- **Built backend APIs and frontend interfaces** for managing access rules, employee assignments, and system configurations.
- **Structured the system architecture to support future NFC-based authentication workflows** and real-time access validation.

AI Chatbot using Rasa | *Python, Rasa, Docker* Dec 2024 – Present

- **Developed an AI-powered chatbot** using Rasa with support for **voice-based interactions**, converting speech to text for real-time conversational processing.
- **Improved user interaction:** Built custom intent classifiers, entity extraction, and dialog management for dynamic responses.
- **Integrated external APIs** to provide real-time data, such as best course, enhancing the bot's practical usability.
- **Deployed the chatbot** using Docker containers for easy integration with cloud platforms, improving deployment scalability and portability.

Experience

Full Stack Developer — ViknCodes Jan 2025 - Present

Remote

- * Architected a multi-tenant SaaS accounting system handling high-volume financial transactions.
- * Designed concurrency-safe voucher generation eliminating race conditions under high parallel load.
- * Reduced database queries from 400+ to 10 using query optimization and caching.
- * Implemented idempotent APIs to prevent duplicate financial entries.
- * Built Celery-based async pipelines for invoicing and background processing, improving system throughput.
- * Ensured data integrity using transaction-safe operations and rollback handling.

Intern, Self Stack November 2023 - Present

Self Stack Solutions

Remote

- * **Developed and maintained frontend features** using React.js, MUI, and Tailwind CSS to create intuitive, responsive user interfaces and elevate user experience.
- * **Implemented state management solutions** with Redux, ensuring scalable, clean, and maintainable code for efficient application performance.
- * **Collaborated with design and backend teams** to integrate RESTful APIs built with Python and Django REST Framework, improving data management and reducing response latency.
- * **Applied Python expertise** to develop backend features and optimize server performance using tools such as Celery for asynchronous task processing.
- * **Optimized application responsiveness and load times** through performance tuning, efficient coding practices, and leveraging modern frontend and backend technologies.
